TECHNICAL ASSESSMENT

Restaurant Billing & Management System

One-Day Development Assignment

Time Limit	Focus	Submission
1 Day	Working Features	Source Code + README

Objective

Build a small Restaurant Management and Billing System. The application should allow a restaurant to manage its basic billing workflow, starting from taking an order through generating the customer's final bill.

You have 1 day to design, develop, test, and submit the application.

What We Are Assessing

1. Thoughtfulness of Implementation

This is intentionally an open-ended assignment. We are not providing a detailed feature checklist. We want to see what features you consider important for a practical restaurant billing application and how you prioritize them within a limited development period.

Think about how the application would actually be used by restaurant staff.

2. Amount of Working Functionality

Candidates who can implement more useful, properly working features within the available time will score higher. However, ten partially working features are not necessarily better than six well-designed and properly functioning features.

3. Code Quality

- Code structure and readability
- Separation of concerns
- Database/data modelling
- Reusability and maintainability
- Error handling and validation
- Appropriate use of frameworks and libraries

4. Bugs and Reliability

Try to keep the application as bug-free as possible. We will test the application ourselves. Features that appear to be implemented but fail during normal usage may not receive credit.

5. UI/UX

The application does not need an elaborate visual design. However, it should be easy to understand, fast to operate, logically organized, and suitable for a restaurant billing workflow. Good usability decisions will receive additional consideration.

Basic Requirement

At minimum, we should be able to understand and demonstrate a basic restaurant flow:

Restaurant Order → Items → Bill

Beyond this, deciding what functionality a useful restaurant management/billing system should contain is part of the assessment. You are encouraged to use your own judgement.

Technology

You may use the technology stack you are most comfortable with unless otherwise instructed by the interviewer. You may use frontend frameworks, backend frameworks, SQL/NoSQL databases, and open-source libraries/packages.

AI-assisted development tools are allowed. We are interested in your ability to use modern development tools effectively while still producing software that you understand and can explain.

Submission

Submit the following:

- Complete source code
- Git repository URL or ZIP archive
- README.md
- Instructions for running the application
- Database setup/migration instructions, if applicable
- Test/demo credentials, if authentication is implemented

The README should briefly explain:

- Technology stack used
- Features implemented
- Application architecture
- Database used
- How to run the project
- Any known issues
- Features you would implement next if additional time were available

Important

Do not spend excessive time making the application visually impressive while leaving the core workflow incomplete. Prioritize working software.

We want to see how much useful functionality you can thoughtfully design, implement, and stabilize within one working day.

Time Limit

1 Day

The final submission time communicated by the interviewer must be strictly followed. Development after the submission deadline will not be considered.
